

Smoke detectors save lives.

**You don't smell anything when you are asleep.
Only your hearing continues to function.**

That is why a smoke detector, which makes a sound, is so important. It gives you time to escape.

Approximately half of all house fires are not fires with huge flames, but smouldering fires. These smouldering fires produce toxic fumes which claim the most victims.

That is why smoke detectors are so important. Install a smoke detector on each floor. It is important that the smoke detector 'guards' the escape route from the bedroom to outside.

***So remember: a smoke detector could save your life
(if you don't forget to check the batteries regularly).***
